Young Iranian software engineer based in Turin, building at the intersection of Bitcoin, open-source, and distributed systems. Capable across the full stack, but his real focus sits in Bitcoin protocol, backend architecture, and the services layer, where reliability and trustlessness actually get enforced.

Studying Electronics and Communication Engineering part-time at Politecnico di Torino while shipping production code, bringing signal-level thinking to software problems most engineers only see from the application layer up. Active open-source contributor to Lightning Network technologies, with a consistent presence in the ecosystem.

Won multiple hackathons back to back, including the AI + Bitcoin PlanB Hackathon and the Lightning Gaming hackathon. Also involved with BitPolito, the Politecnico di Torino student team dedicated to Bitcoin education and development, contributing to several technical projects across Lightning Network and Mining.

Currently full-time committed to KaleidoSwap, owns the backend and services layer end-to-end. Designing and maintaining the infrastructure where protocol logic, payment flows, and system reliability actually live.
