Founder and CEO/CTO with 6+ years of experience in software engineering, specializing in scalable distributed systems, AI microservices, and digital identity infrastructure, with strong expertise in Python, protocol design, and Bitcoin Layer 2 technologies (Lightning, RGB, Spark, Arcade). Strong track record in open-source development and peer-to-peer systems.

Maintained and scaled critical AI infrastructure for a leading digital identity provider in Italy (IBM group), working on production-grade systems with high reliability requirements. Led the Research and Development department at BitPolito, managing a team of 5 and contributing to one of the most recognized Bitcoin student communities in Italy. Core contributor to the RGB Lightning Node ecosystem, with additional open-source contributions across the Bitcoin ecosystem.

Professor of Lightning Network and Layer 2 technologies at Politecnico di Torino, combining education, research, and hands-on protocol development. Winner of multiple hackathons across AI and Bitcoin, including 1st place out of 180 startups at CypherTank Lugano.

Leading the vision, product strategy, and technical architecture of KaleidoSwap. Designing and implementing core protocols and authoring new standards, such as a BLIP for asset metadata in BOLT12. Driving execution across engineering, research, and product to enable peer-to-peer, non-custodial financial infrastructure on Bitcoin.
